

Experiment No : 9.2

Aim : Interrupts

Procedure :

Interrupts are the events that temporarily suspend the main program, pass the control to the external sources and execute their task. It then passes the control to the main program where it had left off. 8051 has 5 interrupt signals, i.e. INT0, TFO, INT1, TF1, RI/TI. Each interrupt can be enabled or disabled by setting bits of the IE register and the whole interrupt system can be disabled by clearing the EA bit of the same register.

IE (Interrupt Enable) Register

This register is responsible for enabling and disabling the interrupt. EA register is set to one for enabling interrupts and set to 0 for disabling the interrupts.

IP (Interrupt Priority) Register

We can change the priority levels of the interrupts by changing the corresponding bit in the Interrupt

Priority (IP) register

TCON Register

TCON register specifies the type of external interrupt to the microcontroller.

Complete the following 8051 assembly programs in EDSIM

4) Assume that the INT1 pin is connected to a pulse generator.

- write a program in which the falling edge of the pulse will send a high to P1.3, which is connected to an LED (or buzzer).

5) Write a program in which the 8051 reads data from P1 and writes it to P2 continuously while giving a copy of it to the serial COM port to be transferred serially. Assume that XTAL=11.0592. Set the baud rate at 9600.

7) Write a program in which the 8051 gets data from P1 and sends it to P2 continuously while incoming data from the serial port is sent to P0.

- Assume that XTAL=11.0592. Set the baud rata at 9600.

8) Write a program using interrupts to do the following:

- (a) Receive data serially and sent it to P0,
- (b) Have P1 port read data and transmit it serially, and a copy given to P2,
- (c) Make timer 0 generate a square wave of 5kHz frequency on P0.1.
- Assume that XTAL-11,0592. Set the baud rate at 4800.

Code & Output :

```
4)
ORG 0000H
LJMP MAIN
ORG 0013H
SETB P1.3
MOV R3,#255
BACK: DJNZ R3,BACK
CLR P1.3
RETI
ORG 30H
MAIN:SETB IT1
MOV IE,#10000100B
HERE: SJMP HERE
END
```

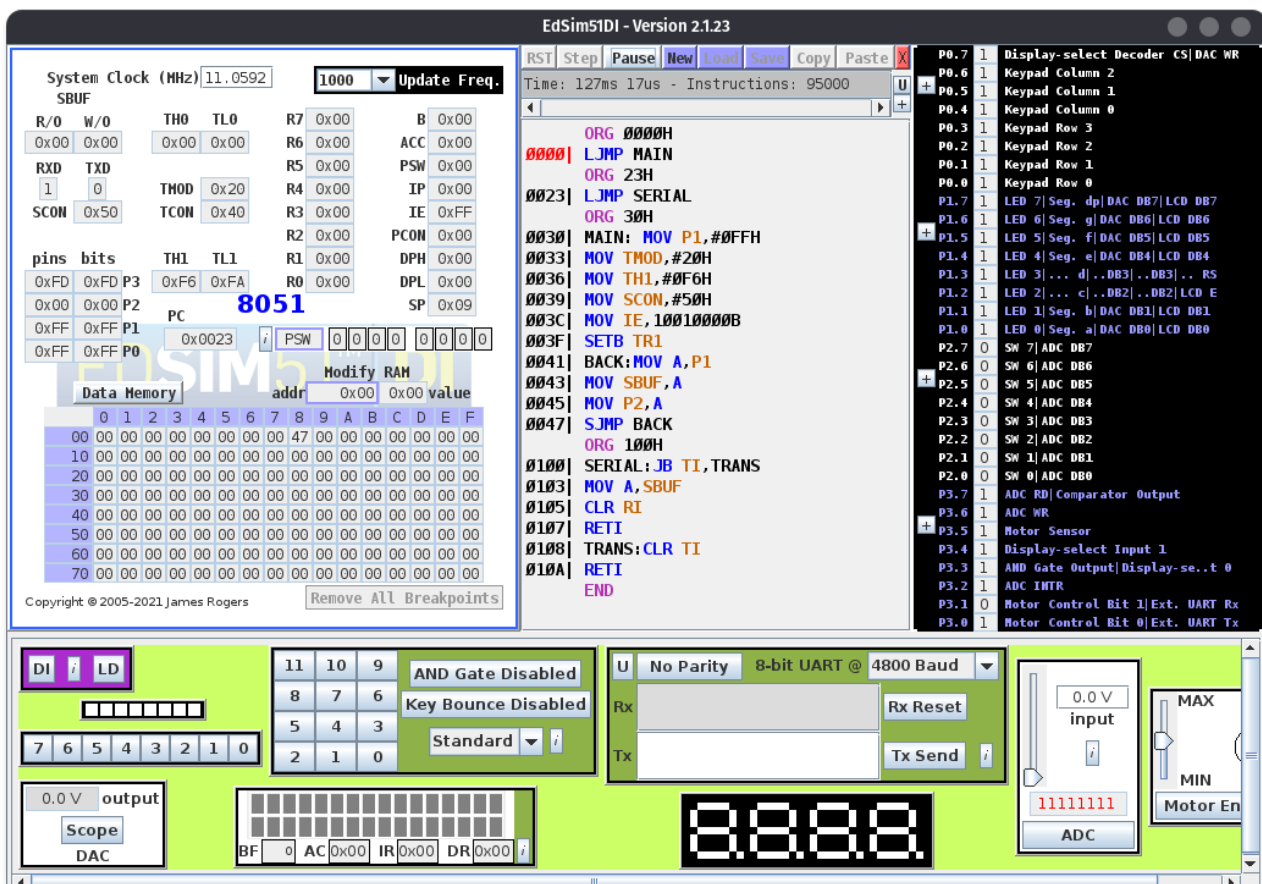

The screenshot displays the EdSim51DI - Version 2.1.23 simulation environment. The interface is divided into several sections:

- Assembly Code:** The central pane shows the assembly code being executed. The current instruction is `0030| MAIN:SETB IT1`. The code includes `ORG 0000H`, `LJMP MAIN`, `ORG 0013H`, `SETB P1.3`, `MOV R3,#255`, `BACK: DJNZ R3,BACK`, `CLR P1.3`, `RETI`, `ORG 30H`, `MAIN:SETB IT1`, `MOV IE,#10000100B`, `HERE: SJMP HERE`, and `END`.
- Registers:** The top-left pane shows the status of various registers. The Program Counter (PC) is highlighted with the value `0x0035` and the label **8051**. Other registers like R0-R7, ACC, PSW, IP, IE, PCON, DPH, DPL, and SP are also visible.
- Data Memory:** The bottom-left pane shows a memory dump with addresses 0 to 70 and their corresponding hex values.
- Hardware Components:** The bottom section shows a virtual hardware board with various components:
 - DI / LD:** Input/Output ports.
 - AND Gate Disabled / Key Bounce Disabled:** Configuration options.
 - Standard:** A dropdown menu for standard settings.
 - UART:** Configuration for 8-bit UART at 4800 Baud, with Rx and Tx lines.
 - ADC:** An Analog-to-Digital Converter showing a value of 11111111.
 - Motor En:** A motor control output.
 - Scope:** A scope showing the output of the DAC.
 - Display:** A 4-digit display showing the value 8888.

```
